

This is the top view of the glass, looking at the APEX (i.e. the left and right sides should be pointing down, and the L-R middle should be the highest point). This is because we are imaging the right side of the brain.

In this orientation (top=front, bottom=back of brain), the brain would be underneath the glass, the tall section on the left side would be near the midline of the brain, the short side on the right would be over auditory cortex / close to the ear.
